GridION

Rapid Sequencing Kit V14 - gDNA (SQK-RAD114)

Version: RSE_9177_v114_revO_09Jan2025

Last update: 1/28/2025

Kit batch number Flow cell number DNA Samples

Checklist: Library preparation

Materials	Consumables	Equipment
100-150 ng high molecular weight genomic DNA	Nuclease-free water (e.g. ThermoFisher, AM9937)	Thermal cycler or heat blocks
Rapid Adapter (RA) Adapter Buffer (ADB) Fragmentation Mix (FRA)	1.5 ml Eppendorf DNA LoBind tubes0.2 ml thin-walled PCR tubes	P2 pipette and tips P10 pipette and tips

Library preparation

Notes / Observations

CHECKPOINT

Check your flow cell.

We recommend performing a flow cell check before starting your library prep to ensure you have a flow cell with enough pores for a good sequencing run.

See the <u>flow cell check instructions</u> in the MinKNOW protocol for more information.

- 1 Once thawed, keep all the kit components on ice.
- 2 Prepare the DNA in nuclease-free water.
 - Transfer 100-150 ng genomic DNA into a 1.5 ml Eppendorf DNA LoBind tube
 - Adjust the volume to 10 µl with nuclease-free water
 - Mix by flicking the tube to avoid unwanted shearing
 - Spin down briefly in a microfuge
- 3 In a 0.2 ml thin-walled PCR tube, mix the following:

Reagent	Volume
100-150 ng template DNA	10 μΙ
Fragmentation Mix (FRA)	1 μΙ

Reagent	Volume
Total	11 µl

- 4 Mix gently by flicking the tube, and spin down.
- 5 Incubate the tube at 30°C for 2 minutes and then at 80°C for 2 minutes. Briefly put the tube on ice to cool it down.

CHECKPOINT

The tagmented DNA in 11 μI is taken into the adapter attachment step.

6 In a fresh 1.5 ml Eppendorf DNA LoBind tube, dilute the Rapid Adapter (RA) as follows and pipette mix:

Reagents	Volume
Rapid Adapter (RA)	1.5 μΙ
Adapter Buffer (ADB)	3.5 μΙ
Total	5 μ l

- \bigcap Add 1 μ l of diluted Rapid Adapter (RA) to the tagmented DNA.
- 8 Mix gently by flicking the tube, and spin down.
- 9 Incubate the reaction for 5 minutes at room temperature.

END OF STEP

The prepared DNA library is used for loading into the flow cell. Store the library on ice until ready to load.

Checklist: Priming and loading the MinION and GridION Flow Cell

Materials	Consumables	Equipment
Flow Cell Flush (FCF) Flow Cell Tether (FCT) Library Solution (LIS) Library Beads (LIB) Sequencing Buffer (SB)	 MinION and GridION Flow Cell Bovine Serum Albumin (BSA) (50 mg/ml) (e.g Invitrogen™ UltraPure™ BSA 50 mg/ml, AM2616) Nuclease-free water (e.g. ThermoFisher, AM9937) 1.5 ml Eppendorf DNA LoBind tubes 	 MinION or GridION device MinION and GridION Flow Cell Light Shield P1000 pipette and tips P100 pipette and tips P20 pipette and tips P10 pipette and tips
Priming and loading th Flow Cell	e MinION and GridION	Notes / Observations
Library Solution (LIS, if usin	before your first run. er (SB), Library Beads (LIB) or ag), Flow Cell Tether (FCT) and Flow reperature before mixing by	
on MinION R10.4.1 flow cells adding Bovine Serum Album mix at a final concentration	d using any other albumin type	
• • •	f reformatting our kits with format. Please follow the	

Single-use tubes format: Add 5 μ l Bovine Serum Albumin (BSA) at 50 mg/ml and 30 μ l Flow Cell Tether (FCT) directly to a tube of Flow Cell Flush (FCF).

Bottle format: In a suitable tube for the number of flow cells, combine the following reagents:

Reagent	Volume per flow cell
Flow Cell Flush (FCF)	1,170 µl
Bovine Serum Albumin (BSA) at 50 mg/ml	5 μΙ
Flow Cell Tether (FCT)	30 µl
Total volume	1,205 μΙ

OPTIONAL ACTION

Complete a flow cell check to assess the number of pores available before loading the library.

This step can be omitted if the flow cell has been checked previously.

See the <u>flow cell check instructions</u> in the MinKNOW protocol for more information.

4 Slide the flow cell priming port cover clockwise to open the priming port.

IMPORTANT

Take care when drawing back buffer from the flow cell. Do not remove more than 20-30 μ l, and make sure that the array of pores are covered by buffer at all times. Introducing air bubbles into the array can irreversibly damage pores.

- 5 After opening the priming port, check for a small air bubble under the cover. Draw back a small volume to remove any bubbles:
 - 1. Set a P1000 pipette to 200 µl
 - 2. Insert the tip into the priming port
 - 3. Turn the wheel until the dial shows 220-230 μ l, to draw back 20-30 μ l, or until you can see a small volume of buffer entering the pipette tip

Note: Visually check that there is continuous buffer from the priming port across the sensor array.

6 Load 800 μl of the priming mix into the flow cell via the priming port, avoiding the introduction of air bubbles. Wait for five minutes. During this time, prepare the library for loading by following the steps below.

IMPORTANT

The Library Beads (LIB) tube contains a suspension of beads. These beads settle very quickly. It is vital that they are mixed immediately before use.

We recommend using the Library Beads (LIB) for most sequencing experiments. However, the Library Solution (LIS) is available for more viscous libraries.

- 7 Thoroughly mix the contents of the Library Beads (LIB) by pipetting.
- 8 In a new 1.5 ml Eppendorf DNA LoBind tube, prepare the library for loading as follows:

Reagent	Volume per flow cell
Sequencing Buffer (SB)	37.5 μl
Library Beads (LIB) mixed immediately before use, or Library Solution (LIS), if using	25.5 μΙ
DNA library	12 µl
Total	75 µl

- Omplete the flow cell priming:
 - 1. Gently lift the SpotON sample port cover to make the SpotON sample port accessible.
 - 2. Load **200 μl** of the priming mix into the flow cell priming port (**not** the SpotON sample port), avoiding the introduction of air bubbles.
- 10 Mix the prepared library gently by pipetting up and down just prior to loading.
- Add 75 µl of the prepared library to the flow cell via the SpotON sample port in a dropwise fashion. Ensure each drop flows into the port before adding the next.
- Gently replace the SpotON sample port cover, making sure the bung enters the SpotON port and close the priming port.

IMPORTANT

Install the light shield on your flow cell as soon as library has been loaded for optimal sequencing output.

We recommend leaving the light shield on the flow cell when library is loaded, including during any washing and reloading steps. The shield can be removed when the library has been removed from the flow cell.

13 Place the light shield onto the flow cell, as follows:

- 1. Carefully place the leading edge of the light shield against the clip. **Note:** Do not force the light shield underneath the clip.
- 2. Gently lower the light shield onto the flow cell. The light shield should sit around the SpotON cover, covering the entire top section of the flow cell.

CAUTION

The MinION Flow Cell Light Shield is not secured to the flow cell and careful handling is required after installation.

END OF STEP

Close the device lid and set up a sequencing run on MinKNOW.

Checklist: Flow cell reuse and returns

Materials	Consumables	Equipment	
Flow Cell Wash Kit (EXP-			
WSH004)			

Flow cell reuse and returns

Notes / Observations

1 After your sequencing experiment is complete, if you would like to reuse the flow cell, please follow the Flow Cell Wash Kit protocol and store the washed flow cell at +2°C to +8°C.

The <u>Flow Cell Wash Kit protocol</u> is available on the Nanopore Community.

TIP

We recommend you to wash the flow cell as soon as possible after you stop the run. However, if this is not possible, leave the flow cell on the device and wash it the next day.

2 Alternatively, follow the returns procedure to send the flow cell back to Oxford Nanopore.

Instructions for returning flow cells can be found here.

IMPORTANT

If you encounter issues or have questions about your sequencing experiment, please refer to the Troubleshooting Guide that can be found in the online version of this protocol.
